How Do Dinosaurs Learn Their

Ornithischia (/ ɔːr n ə ' θ i s k i . ə /) is an extinct order of mainly herbivorous dinosaurs characterized by a pelvic structure superficially similar to that of birds. The name Ornithischia, or "bird-hipped", reflects this similarity and is derived from the Greek stem ornith-(ὄρνιθ-), meaning "of a bird", and ischion (ἴσχιον), plural ischia, meaning "hip joint".

Ornithischia - Wikipedia

In a way, turtle evolution is an easy story to follow: the basic turtle body plan arose very early in the history of life (during the late Triassic period), and has persisted pretty much unchanged down to the present day, with the usual variations in size, habitat, and ornamentation. As with most other types of animals, though, the turtle evolutionary tree includes its share of missing links ...

250 Million Years of Turtle Evolution - ThoughtCo

The dinosaurs of the Mesozoic Era obviously didn't brush their teeth or floss. Some experts think shards of rotten, bacteria-infested meat constantly lodged in its closely packed teeth gave Tyrannosaurus rex a "septic bite," which infected and eventually killed its wounded prey. This process likely would have taken days or weeks, by which time ...

10 Facts About Tyrannosaurus Rex, King of the Dinosaurs

The tallest dinosaurs were the Brachiosaurid group of sauropods. Their front legs were longer than the rear legs giving them a giraffe-like stance. This combined with their extremely long necks, which were held vertically, meant they could browse off the tallest trees. Brachiosaurus - the most well known of the group - was 13 metres tall.
