IPv6 Addressing and Subnetting. Addressing and Subnetting in IPv6 is a bit different from IPv4. IPv4 organizes the address space in a couple of ways. First, IPv4 splits addresses by class, with classes A, B, and C defining unicast IPv4 addresses. Then, within the class A, B, and C address range, the Internet Assigned Numbers Authority (IANA) and the Internet Corporation for Assigned Names and Numbers (ICANN) reserve most of the addresses as public IPv4 addresses, with a few reserved as ...

Here, our Subnetting bits that we will use on an address will be calculated according to our need. For example, if we have a /48 prefix and we need 8 subnets, we can use 3 subnetting bits (23=8). Our slash notation will be 48+3= 51 (/51). With this IPv6 Subnetting , we can use 8 subnets with this IPv6 Prefix.

data. Since each host on the Internet has its own IP address to uniquely identify itself, Host A can specify the destination IP address it wants the data sent to as an end point. Another component of the information that will be sent in the data packet is the source IP address the packet was sent from. Figure 1.2, demonstrates this concept.
