In this article, we'll use Scilab to decode an FSK signal, but the computations involved are not complicated and could easily be implemented as C code in a digital signal processor. First Things First: The Math. Our technique for decoding FSK is based on the multiplication of sinusoidal signals.

Consider the following trigonometric identities:

Scilab provides tools to visualize, analyze and filter signals in time and frequency domains. Sampling. Here is the example of a bad sampling of a sine signal: `nb_pts=16; step=2e-3; t=step*(0:1:nb_pts-1); amp=3;f=100; s=amp*sin(2*%pi*f*t); plot2d(t,s); plot2d3(t,s,style=color('red'))` Fourier Transform

The creation of synthetic signals can be accomplished using the Scilab function `rand` which generates random numbers. The user can generate a sequence of random numbers, a random matrix with the uniform or the gaussian probability laws. A seed is possible to re-create the same pseudo-random sequences.
